

ASTROMETRY

Theta & Rho

ASTROMETRY - Theta & Rho

Overview

Stars are measured/studied via two primary methods: Astrometry and Photometry

Astrometry (the focus here):

Measures a star's, or another celestial object's, position in the sky and its movement. Think of it as finding the Latitude/Longitude of a place on earth. You are finding the position of an object in the night sky.

Photometry:

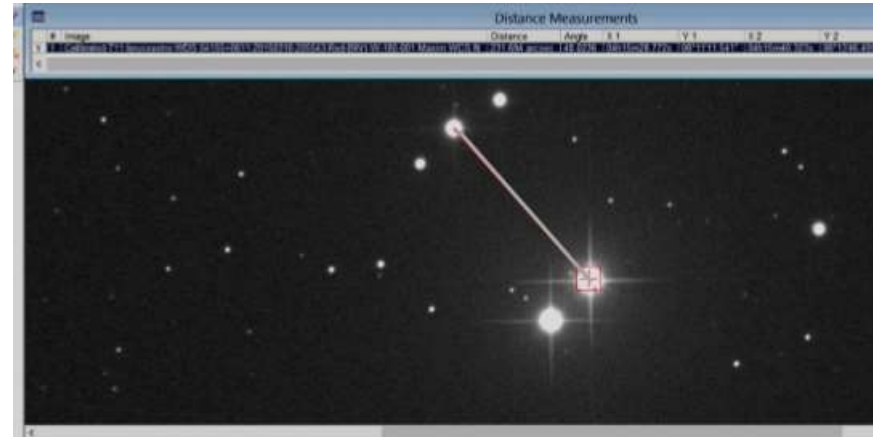

Measures a star's, or another celestial object's, flux (light output). This technique focuses on light capturing, changes, output, etc.

ASTROMETRY - Theta & Rho

Theta & Rho

- **THETA** (*a.k.a. Position angle*) (PA, θ) is measured in counterclockwise degrees from the line to celestial north
- **RHO** (*a.k.a. Separation*) (Sep., ρ) is angular distance between two objects in arcseconds
 - 1 arcsecond = $1/3600^\circ$... the visual width of a golf ball at $5\frac{1}{2}$ miles)

Pair	Obs. History			Separation (")			Position Angle (°)		
	#	First	Last	First	Last	2015	First	Last	2015
STTA 45 AB	37	1875	2012	65.47	64	64.3	314.8	315.9	315.069
H 6 98 AC	13	1885	2011	213.3	234.42	233.01	47.4	47.7	48.09

ASTROMETRY - Theta & Rho

Today's Measurements of Theta and Rho

ASTROMETRY - Theta & Rho

Summary

Theta & Rho are the position angle, measured from North, and separation of two objects.

These are most common in the science of Double Star observations.

While other tools used to be employed for this, we now measure WCS coordinated images with software tools such as MIRA and AIJ.
